

Project 1 - Tips

1. How many spaces do you need to print in the each row before the first character of the diamond? You need to figure out the pattern of spaces and symbols to print in order to make the diamond.

Row 0 →				B			
Row 1 →			B	B	B		
Row 2 →		B	B	B	B	B	
⋮	B	B	B	B	B	B	B
		B	B	B	B	B	
			B	B	B		
				B			

2. Don't forget you can combine strings by adding them: `"try" + "this" + " out !"`. You can also repeat a string if you multiply it by a number.
3. To print a string without starting a new line, use the optional `end = ""` argument:

```
print("any string", end = "")
```

4. Would it be helpful to use more than one for-loop for different parts of the diamond?
5. It helps to know the location of the middle row. With n rows, the middle row is n divided by 2 rounded down (if you start counting from row 0). Use the **integer division** operator `//` which divides integers and returns the answer without the remainder. Here are some examples:

```
4 // 2 # returns 2
7 // 2 # returns 3
```
